**[57] Abstract:**

Speech entering method as motor vehicle destination address in real time  
The method involves detecting the user's speech by means of a speech recognition device which classifies the speech according to identification probability, and identifies the speech with the highest probability as the entered speech. At least one permitted spoken word is a command which activates the system. All permitted words are held in a data base.

At least one control function contains an input dialogue. At least one lexicon is generated from the stored words, after a control function of the system is activated. The lexicon is loaded into the speech recognition device as its vocabulary.
